

```
<?php

//these are the server details

//the username is root by default in case of xampp

//password is nothing by default

//and lastly we have the database named android. if your database name is different you have to
change it

$servername = "localhost";

$username = "root";

$password = "";

$dbase = "attensys";

//creating a new connection object using mysqli

$conn = new mysqli($servername, $username, $password, $dbase);

//if there is some error connecting to the database

//with die we will stop the further execution by displaying a message causing the error
if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
}

?>
```
